INFLATABLE PROJECTION SPHERES

On land, On water, In the air

The inflatable projection spheres are a 5M diameter spherical projection surface. They produce excellent results with laser projection, video projection or intelligent lighting.

They have many applications and can be used,

Indoors: As massive illuminated features or spherical projection surfaces, or even glowing features lit up by intelligent lighting,

Outdoors: As large spherical billboards or projection screens.

In the Air: They can be filled with helium to make them float whilst being projected onto via laser or video projection.

On the water: These particular spheres can also be used on water as a floating projection screen.
